Are You Scuba Fit?

USA. His practical research included studies such as measuring a diver’s heart rate while putting on a wet-hot summer suit. Discussions are helpful in understanding and emphasizing the importance of training to improve diving performance and safety.

Scuba diving itself should not feel like a workout. Developing a healthy heart and lungs, muscle strength and flexibility, overall endurance, and eating well for diving are, for very important reasons, accomplished on and above the surface.

Getting started
My surveys reveal that less than 30 percent of all divers exercise. For divers who are new to exercise, it is important to take responsibility for your health, bring focus and motivation to a fitness routine and improve your overall diving performance. Be concerned more with what’s under your T-shirt than what is on it.

It was five years that I began to fitness for and redefined it primarily as a medical condition of divers. To create a distinction in early discussions, it was necessary to specify physical fitness for diving.

Fortunately, because of opportunities such as this, fitness for diving is being transferred to a home gym or outdoors by using free weights. This is an intermediate workout and a good goal for healthy, injury free divers that have been exercising consistently at least two times per week for three months to a year, or at least three times per week for six months. It is important to remember not to exercise 24 hours before or after diving.

To begin, it is recommended to read through the entire program for an introduction to interval training, review the exercises to determine which ones are best for you, and use the formula to calculate the best workout.

What follows is an overview of specific goals.

Text and photos by Gretchen M. Ashton, CFT, SFT, SFN, NBFE Founder of ScubaFit®

Long after the jet lag and the first day back to work, you slip into your favorite dive T-shirt eager to keep the essence of your most recent underwater experience pulsing through your mind and body. Proudly wearing large print logos across your chest is a way of celebrating your passion for diving and sharing it with the rest of the world. And why not? Beyond the obvious comfort of a cotton dive T, diving is a recreational activity almost anyone can enjoy, and the rest of the world to see?

Would you be as enthusiastic about your cholesterol or body weight in large print for everyone to see? The rest of the world? And why not? It becomes a way of life. Now imagine if you pulled on your favorite dive T-shirt and some- one had changed the slogan of your T-shirt to what is on it. With what’s under your T-shirt than what is on it.

To begin, it is recommended to read through the entire program for an introduction to interval training, review the exercises to determine which ones are best for you, and use the formula to calculate the best workout.

What follows is an overview of specific goals.
The Leg Press combines all major muscles of the legs and buttocks along with the abdomen and low back. It is foundational in nature and recommended as an alternate to the squat to reduce risk and accommodate certain knee and back conditions.

Aerobic training zones
To maximize the benefits of training, it is necessary to establish your heart rate training zones. These training zones are based on your maximum heart rate, which is the highest number of times your heart can contract in one minute. Working within 60-80 percent of your maximum heart rate is most beneficial for overall health. The 70-80 percent heart rate training zones improve the ability of the body to take in and distribute adequate amounts of oxygen to working muscles during physical activity.

If you have heart conditions, it is recommended that you measure your maximum heart rate by taking a max stress test administered by a physician. Otherwise, the most respected fitness standard for calculating your training heart rate zones is the Karvonen Formula developed by internationally renowned physician and exercise physiologist, Martti Karvonen.

As soon as you wake up in the morning, before you get out of bed, take your resting pulse by placing two fingers under the back corner of your jaw or on your wrist and count your heart beat for one minute. This number is your Resting Heart Rate.

Use this number to perform the following Karvonen calculation. Subtract your age from 220. From this result subtract your Resting Heart Rate (RHR). Then multiply this number by your training intensity of 70 percent (repeat the formula for 80 percent).

Lastly, add your Resting Heart Rate back in to get your Training Heart Rate (THR). An example looks like this: 220 – (AGE) 45 = 175; 175 – (RHR) 68 = 107; 107 x 70% = 75; 75 + (RHR) 68 = 143 [THR].

Using this example, while training in your 70 percent heart rate training zone, you will attempt to maintain a minimum pulse of 143 beats per minute. Your 80 percent heart rate training zone provides a maximum pulse of 154 beats per minute. However, if you are a beginner, work at 60 percent intensity until these higher percentages can be performed while still able to carry on a conversation.

The custom program I describe here applies the 70 percent heart rate training zone primarily to improve the muscle cells ability to utilize oxygen. This zone trains the heart to pump more blood, metabolizes stored body fat as the primary source of energy, is preferred for weight management, and is a healthful intensity in preparation for moderate scuba diving conditions.

Training in the 80 percent zone is most effective for overall cardiovascular fitness. The following custom program uses this heart rate training zone to improve the body’s ability to transport oxygenated blood to the muscle cells and carbon dioxide away from the cells. This zone is also effective for increasing overall muscle strength. A training zone of 80 percent of your maximum heart rate is similar to the work of swimming against a moderate current.

Notably, the 90 percent zone, while sometimes used for short periods to train for high levels of athletic performance, is not considered a healthful zone for recreational activity. However, of considerable importance is that exercising with consistency in the heart rate training zones of 70-80 percent may prepare you for a time when you may need to exert beyond usual conditions.

Training with a heart rate monitor is a great way to easily know if you are working in your training zone and is recommended for individuals with heart disease or pulmonary conditions. It is recommended to rely on heart rate monitors primarily during aerobic intervals. During resistance training intervals your heart rate will naturally fall slightly below your target training zones.
The “Basic Six” Exercises

The program designed for divers employs functional exercises, which systematically involve muscle combinations and sensory adaptations associated with body position and movement during scuba diving. Utilizing both dynamic and static positions, this workout is designed around six basic exercises. Alternate exercises are provided for the most common conditions of the shoulder and knee. Substitute alternate exercises for Basic Six exercises as indicated.

The Leg Press combines all major muscles of the legs and buttocks along with the abdomen and low back. It is foundational in nature and recommended as an alternate to the squat to reduce risk and accommodate certain knee and back conditions. Direct advantages include all movements under the load of gear, especially standing from a seated position, and climbing a boat ladder or steps. This exercise also includes some integration of static chest and shoulder. Swimming, wave action, surf, strong currents, turtle swimming, and sand are all conditions that contribute to diving.

Dolphins incorporate low back, hamstrings, gluteus and abdominal muscles in a prone position using the lower body as resistance instead of the upper body. Walking backwards, kicking through, and prevent injury. The Pullover combines the chest, shoulders, triceps, and abdominal muscles and expands the chest improving breathing capacity. The ability to safely reach over and beyond your head and back is the greatest benefit of this exercise. The Shoulder Combo is a therapeutic alternative or supplemental exercise sequence for the Pullover.

A Row of any fashion incorporates five muscles in the back and shoulder and is assisted by the biceps to perform pulling activities. Large back muscles as a group, are second only in size to those of the legs and likewise apply to foundational strength. The row requires a greater demand for oxygen than other upper body exercises and you will notice a slightly higher heart rate during this resistance training interval.

The Shoulder Combo: Internal / External Rotation for the Rotator Cuff. These exercises are provided to both rehabilitate and prevent injury of the shoulder.

Interval Training

The program comes to life with the unique application of “interval training”. Typically used to enhance running performance, interval training is applied to your resistance training in this workout. Instead of counting repetitions, you will perform timed sets of each exercise. To prevent injury, begin your workout with a six-minute warm-up of aerobic exercise (i.e. walking outdoors, treadmill, elliptical, bicycle). When performing resistance training exercises remember to breathe properly. Inhale through the nose and exhale through the mouth. Do not hold your breath at any time under resistance and exhale on the exertion. Do not rest between exercises unless absolutely necessary. Remember to check your heart rate about halfway through each Resistance Training Interval. Each Basic Six Exercise Sequence will take six minutes to complete. If you are performing an exercise requiring a single leg or single arm movement, per-

![The Shoulder Combo](image)

**Ball Reach**

A ball reach on knees starting position and extended position. The Ball Reach provides a unique combination of abdominal, low back, hamstring and gluteus strength. This exercise also includes some integration of static chest and shoulder. Swimming, staying in one place during strong currents, putting on fins in the water, and back-roll entry are just a few examples that contribute to diving.

**Knee Trio**

The Knee Trio: Bun Wrapper, Wall Sit with Ball Squeeze. The Bun Wrapper is a combination of leg raises throughout the full complement of hip rotation, which targets the medial muscles of the gluteus and provides weight-bearing benefits for those with an orthopedic condition, the Knee Trio shown later in the workout is a therapeu tic alternative or supplemental exercise sequence to the Leg Press.

**Basic Six Exercises**

The Basic Six exercises are provided for the most common conditions of the shoulder and knee. Substitute alternate exercises for Basic Six exercises as indicated.
form each side for one full minute. Replacing pullovers or push-ups with the Shoulder Combo or replacing Leg Press with the therapeutic Knee Trio will require from six to 12 minutes to complete.

After your warm-up, perform your first resistance training sequence consisting of one-minute intervals for each exercise. Then return to aerobic training for six minutes in your 70 percent training heart rate.

Perform a second full sequence of resistance training intervals followed by a second session of aerobic training.

The program is designed to strengthen and condition the body in a safe manner. Consistency is important with this workout. Establish a good foundation by training all year to support diving activities. Now, pack a gear bag with a stopwatch or timer, hydrating drink, and a towel.

Put on your favorite dive t-shirt and take your enthusiasm for scuba diving to the gym. It’s time to get scuba fit! In the next issue, we will discuss training for the arms in the fitness column, Neptune’s Triceps.

Gretchen M. Ashton is registered with the National Board of Fitness Examiners. An advanced diver, International Sports Sciences Association Elite Trainer, and world champion athlete, Ashton developed the ScubaFit® program and the comprehensive FitDiver® program, which includes the first mobile app for scuba diver fitness. Ashton is the co-author of the PADI ScubaFit Diver Distinctive Specialty course and is an Expert Speaker for Los Angeles County’s Advanced Diver and Underwater Instructor Certifications in California, USA. She is the Health and Fitness Editor of California Diver Magazine, has been published in Divers Alert Network, Alert Diver - United States and Asia-Pacific, on DiveTime.com, and is a Scuba Fitness Examiner at Examiner.com. Ashton has appeared on Scuba Radio, presented at the Scuba Show, has been featured in the President’s Council of Physical Fitness and Sports newsletter for inspiring and innovative accomplishments in fitness, and in the Margaritaville Key West website culinary column. As an athlete, she set 21 World and American records and was the second women inducted into the Amateur Athletic Union (AAU) Power Lifting Hall of Fame: See: ScubaFit.com
